

Build Week Founder Cheat Sheet

Everything you need to pitch, defend, and demo **Inventra AI** – the AI copilot for inventory-driven SMEs. Read it tonight, skim Section 8 in the morning.

POSITIONING: AI COPILOT FOR INVENTORY-DRIVEN SMES

MVP: 7 FEATURES, LIVE

LINE: DECISIONS, NOT DASHBOARDS

01

SECTION 01

30-Second Elevator Pitch

For hallways, coffee queues, and "so what do you do?" Say it in one breath, land the last line.

● TARGET 0:30 • ~60 WORDS

"Most small distributors and mini marts still run inventory on spreadsheets and gut feel – so they get surprised by stockouts, and their cash gets stuck in products that aren't selling. **Inventra AI** is a copilot for inventory-driven SMEs. You upload your stock spreadsheet, and in about thirty seconds you get an inventory health score, a breakdown of the revenue you're about to lose, and a short list of what to do this week. It's the difference between finding out you've run out and being told three weeks early."

1-Minute Mini Pitch

For the worksheet and the mini pitch challenge. Four beats – Problem, Customer, Solution, Impact – roughly 15 seconds each.

 TARGET 1:00 • FOUR BEATS

PROBLEM

Inventory is the biggest asset on an SME's books and the least visible. Owners manage it in spreadsheets that don't warn them about anything. Stockouts arrive without notice, and cash sits frozen in slow-moving stock for months.

CUSTOMER

The people who feel this hardest are FMCG distributors, mini marts, and retail SMEs – businesses with hundreds of SKUs, thin margins, and no analyst on staff. The owner is the analyst, at 11pm, in Excel.

SOLUTION

Inventra AI turns that spreadsheet into decisions. Upload your product export and you get an Inventory Health Score, a Revenue-at-Risk analysis that ranks every product by the money lost if it runs out, a plain-language AI Business Brief, and an Action Center that says what to do first. You can also simulate scenarios – "what if demand jumps 20%?" – before they happen.

IMPACT

Owners move from reactive to proactive: fewer stockouts, less trapped cash, and a weekly decision list instead of a monthly surprise. The analysis that took a day in Excel takes about thirty seconds.

03

SECTION 03

Problem Statement

One sentence to memorize, three facts to back it up.

Inventory-driven SMEs make high-stakes stocking decisions with tools that give them data but no direction — so problems get discovered only after they've cost money.

- 01 Spreadsheets are static. They store quantities, but they don't flag risk, rank urgency, or recommend an action.
- 02 Stockouts and overstock are opposite failures of the same missing signal: *when* to reorder, and *how much*.
- 03 The owner is usually the only person doing this analysis — without training, without time, and without a second opinion.

Customer Segment

Same underlying pain, three concentric rings. Lead with the primary; mention the others only if asked.

1**PRIMARY**

FMCG distributors. Hundreds to thousands of fast-moving SKUs, tight margins, and channel commitments. A stockout on a top-mover is an immediate, measurable revenue loss and a relationship risk with the retailers they supply.

2**SECONDARY**

Mini marts & retail SMEs. Smaller catalogs but the same problem and even fewer resources – often a single owner-operator doing buying, selling, and the books.

3**EARLY ADOPTERS**

Spreadsheet-native owners and inventory managers who already keep a structured stock sheet or can export one from their POS or accounting tool, are already frustrated by stockouts, and will try a web tool for an edge. Digitally literate, actively looking for a better way.

Value Proposition

Two comparisons cover almost every "why you?" – against the spreadsheet they use now, and against the ERP a mentor will name.

VS.

A manual spreadsheet

- Spreadsheets *store*; Inventra *decides* – same data in, a ranked action list out.
- Every product scored and sorted by revenue at risk, not buried in rows.
- Plain-language brief: what's wrong, what it costs, what to do – in seconds, not a day of formulas.
- Forward-looking: test a decision with scenario simulation before committing stock and cash.
- No formula maintenance, no broken references, no version-in-an-email.

VS.

Traditional inventory software

- Works from a spreadsheet upload – no migration, no implementation project.
- Answers "what should I do?", not just "what do I have?" – a system of advice, not just record.
- Scoped and priced for an SME, not a warehouse operation.
- Minutes to first value instead of a multi-month rollout.
- A copilot you can ask questions, versus dashboards you have to interpret yourself.

Common Mentor Questions

Answer in two sentences, then stop. Italics mark where you plug in your own traction.

Q What problem are you solving?

SMEs manage inventory on spreadsheets and intuition, so they get blindsided by stockouts and trap cash in dead stock. They have data but no direction.

Q Why is this important?

Inventory is the largest chunk of working capital and a top controllable cost for these businesses. Better calls on what to reorder and when flow straight to cash and margin – and reactive decisions compound.

Q Who has this problem?

Inventory-driven SMEs – FMCG distributors first, then mini marts and retail SMEs. Hundreds of SKUs, thin margins, no dedicated analyst.

Q How do they solve it today?

Manually: a spreadsheet, reorder points in someone's head, and firefighting when a shelf goes empty. Some have an ERP that records stock but doesn't advise.

Q Why is your solution different?

We start from the spreadsheet they already have – zero implementation – and we output **decisions**: a health score, a revenue-at-risk ranking, a plain-language brief, a prioritized action list, plus scenario simulation to test a move before making it.

Q How will you get customers?

Direct outreach to distributors and retail associations, partnerships with the POS and accounting tools whose exports we read, and referrals inside tight distributor networks. The wedge is a free analysis of their real spreadsheet.

Q How will you make money?

SaaS subscription, tiered by SKU count and number of locations. Land with a one-off free brief; convert to a monthly plan for ongoing monitoring, alerts, and the copilot.

Q What evidence do you have?

A working MVP with seven features end-to-end; the analysis engine runs on real spreadsheet exports today.

Add your own: design-partner conversations, pilot sign-ups, early user feedback, a demo with a real distributor's data. This is the slot mentors probe hardest – walk in with something concrete.

Q What assumptions still need validation?

Four big ones: (1) owners will upload their real data to a new tool; (2) the health score and risk ranking match what an experienced owner would conclude, and get trusted; (3) willingness to pay a monthly fee, and at what price; (4) spreadsheet quality across the segment is good enough to analyze without heavy cleanup. Underneath all of it: that the recommendations get *acted on*, not just read.

Demo Walkthrough

Two minutes, one path: Upload → AI Analysis → Revenue Risk → Action Center → Copilot. Have the sample CSV loaded and the tab open before you start. Timings are approximate – trim to fit.

Open with: "I'll upload a real distributor's product export, and we'll go from a spreadsheet to a prioritized decision list in under two minutes."

1 /upload (~20s)

SAY "This is a normal product export – SKU, stock on hand, sale price, sales history. I drag it in. Every row is parsed and validated in the browser, so I see exactly what's being imported before I commit it. It also recognizes and cleans up messy product names automatically."

Then click commit. Don't linger on the table.

2 /brief – AI Business Brief (~35s)

SAY "Straight away I get the Business Brief. Top-left is the Inventory Health Score – this catalog is a 61 out of 100. Below it, the executive summary in plain English: the critical risks, where revenue is exposed, and the recommended actions. This is the page I'd send an owner every Monday morning."

3 /revenue-risk – Revenue Protection Center (~30s)

SAY "Every product ranked by revenue at risk – days until stockout, times daily sales, times price. These at the top are Critical: under three days of cover. That's not a data point, that's next week's lost sales. Search, sort, and filter across the whole catalog."

4 /actions – Action Center (~20s)

SAY "The Action Center turns that into tasks – reorder these three now, review pricing on this slow-mover, redistribute this overstock. Prioritized, so the owner knows what to do first, not just what's wrong."

5 /copilot – AI Copilot ~25s

SAY "And I can just ask. 'Which products should I reorder before the weekend?' The copilot answers from *this* catalog – their numbers, not generic advice."

Close: "Spreadsheet to prioritized action list, in the time it takes to make coffee. That's Inventra."

What To Remember Tomorrow

If you memorize one thing, memorize this. Screenshot it.

< CUT HERE — THE ONE-PAGE CARD >

Inventra AI — pocket card

An AI copilot for inventory-driven SMEs. Upload a spreadsheet → get decisions, not dashboards.

PROBLEM	Spreadsheets + intuition → surprise stockouts, trapped cash, no visibility into risk.
CUSTOMER	FMCG distributors (primary); mini marts & retail SMEs (secondary). Hundreds of SKUs, thin margins, no analyst.
SOLUTION	Health score, revenue-at-risk ranking, plain-language brief, prioritized action list, scenario sims.
7 FEATURES	Smart Import · AI Business Brief · Revenue Protection · Copilot · Simulator · Action Center · Product Recognition.
VS SPREADSHEET	Spreadsheets store; Inventra decides.
VS ERP	No implementation. Answers "what do I do?", not just "what do I have?"
MONEY	SaaS subscription, tiered by SKU count & locations. Free brief → monthly plan.
DEMO PATH	Upload → Brief → Revenue Risk → Action Center → Copilot.
THE ONE NUMBER	~30 seconds from upload to a decision list.
IF ASKED FOR PROOF	Working MVP, 7 features, runs on real exports today – plus [your pilot traction].
BIGGEST OPEN Q	Will owners upload real data and pay monthly?

Say it: "Decisions, not dashboards."
